MI-SI

FLEXIBLE, LIGHTWEIGHT “ALIGN” PREAMP

THE ALIGN AMPLIFIER from Mi-Si is a flexible, compact, lightweight battery-free preamp. The board thickness is just 20 mils thick versus more traditional circuitboards that are 62 mils thick. It comes standard with active bass, treble, and volume controls and can be installed virtually anywhere within the instrument. The Align can be bent up to a radius of 40mm. There is no dan-

ger of damaging components because they all are sitting on stiffened areas directly under the pots.

Designed to work with the L.R. Baggs Element pickup, the Align can also be easily tweaked to work with any brand pickup. For more “flexibility” in placement, the board can be cut into two or three sections, allowing for even

more complicated installations. The Align is an ideal choice for amplifying ukuleles, mandolins, violins, and other smaller-bodied acoustic instruments. Like any other Mi-Si preamp, it requires no batteries and takes only 60 seconds to charge. A single charge will net eight hours of active preamp power. (617) 795-2146

The World's Most Flexible Preamp

Align from Mi-Si
Hugs the curves of any acoustic stringed instrument with first-class performance. Easy to install. Easy to use. Battery-free.
